A world of possibilities

Transfer hearse

Transfer hearses

InvestAuto is a company that has a huge influence on the culture of design of transfer hearses.

Its work methodology has provided some of the most **prominent developments** in the projection of this type of car.

InvestAuto takes into account even the **smallest detail** in the development of all its models, thus providing **high quality** transfer hearses to the funeral market.

The speed to get to the scene, the complexity of the streets to cross or the material to be

transported to organise a service, are some of the factors that can determine the final design of a transfer hearse.

In addition, all hearses of InvestAuto strictly follow the guidelines set by the legislation, adapting to the **specific regulations of each region or country.**

In this regard, those laws governing special refrigeration or air conditioning and lighting according to the **Road Traffic** Laws must be taken into account.

For **judicial transfers**, these vehicles are provided with a **bridge of signalling lights** usable in emergency cases.

Vito

Elegance and functionality

InvestAuto has developed a **new interior design** for the Mercedes Benz Vito, a funeral service van that stands out for its elegance and functionality.

InvestAuto team has **reinterpreted the inner lines of the vehicle, in order to maximize their usable space.** Of course, InvestAuto has remained true to their principles of design. For this reason, a consistent interior image that suits the outside concept of the vehicle has been applied, respecting its pure and apparently simple lines.

As a result, the interior and exterior image of Mercedes-Benz Vito hearse have been unified. Moreover, some chrome interior finishing has been added, providing greater subtlety and elegance.

The sensitivity of InvestAuto for a well-done job can be seen in both the finishing and materials of this van.

Vito: versatile, personalized and equipped with all kinds of details

Evolutionary design

The new exterior design of the Mercedes Benz Vito van has demanded the creation of a more modern and sober line. This model is an efficient **transfer long-van** with normal roof, unglazed and increased MAM to 2940 kg, required to homologate the necessary charge for the service.

Functionalism

The new Mercedes Benz Vito van has a studied passenger compartment that allows **the transfer of four bodies**, in a coffin or on a stretcher, two on the lower floor and two on the top.

This vehicle can also incorporate a **lift platform on the second floor** that apart from creating a lower compartment with a removable floor, eases loading and unloading thereof.

InvestAuto also offers the opportunity to integrate a cabinet that is accessible from the sliding right side door.

Technological precision

The inner lining of the compartment in **ABS** is very easy to clean and maintain. In this regard, it is noteworthy that **Bertex technology** is used, a paint that makes a customizable, easy to clean and resistant to friction surface.

On the other hand, the floors are made of stainless steel and the plywood cabinet color matches the rest of the vehicle.

Versatility

InvestAuto **can customize this vehicle** depending on the needs of customers. For this reason, various possibilities of construction, **colorimetry and finishing** in relation to both the materials and to the platform have been developed.

Regarding the platform, it is noteworthy that InvestAuto has developed a **fix version** with several positions and an **automatic version**. Thanks to this last, the route of position suits the particular needs of each service. In both cases, the customer can choose from a wide **range of metallic finishes**, whether **matte, glossy** type or incorporate **geometric motifs**.

The enormous capacity of design of InvestAuto makes it possible for the bodies to be transferred both in a **coffin** and on a **stretcher**, offering a **large number of configurations**.
